Humla v1.0

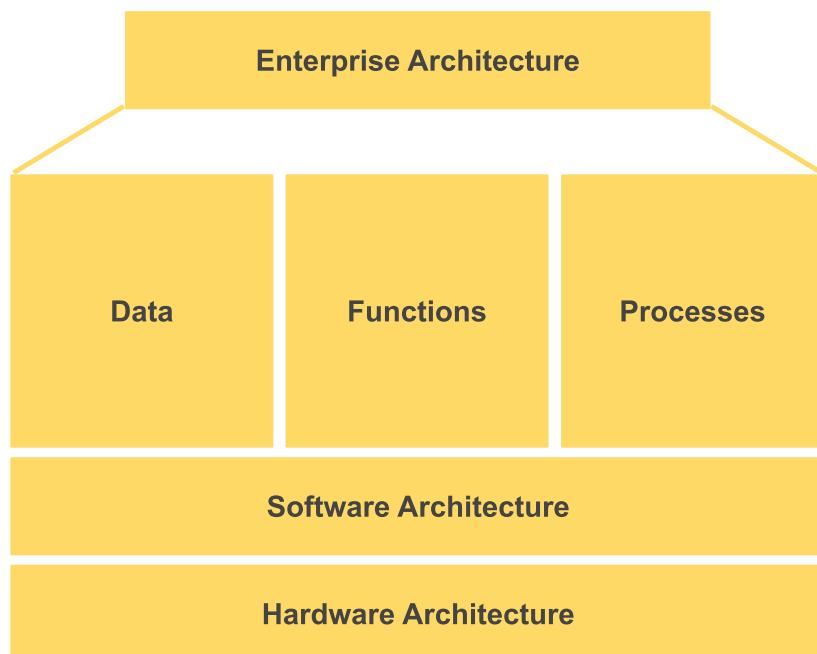

Overview

- Architecture Overview
- Software Architecture

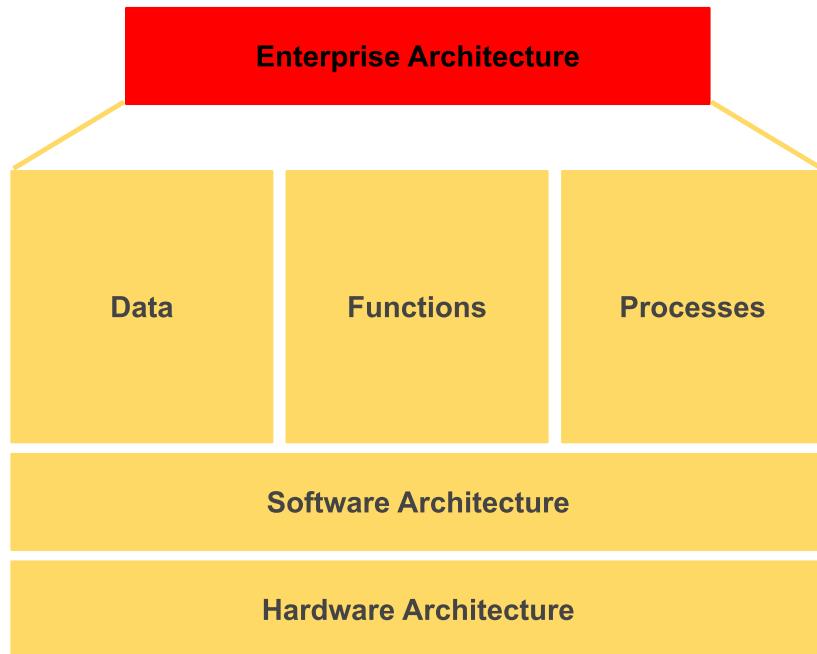

Global Architecture

- A **structure** and a **behavior** of system's parts
- Complexity – views on the global architecture
 - *basic architectural views (also called dimensions): enterprise, data, functional, process, software, hardware.*
- Development
 - *basic methodology and actors:*
 - ~ analysis, design, implementation, testing, maintenance
 - ~ end-user, architect, developer, administrator
 - *basic architectural development levels:*
 - ~ conceptual, logical, physical.
- Global architecture and cloud computing
 - *data, functions, processes are application (domain) specific*
 - *software architecture defines a software platform*
 - *hardware architecture defines an infrastructure*

Views

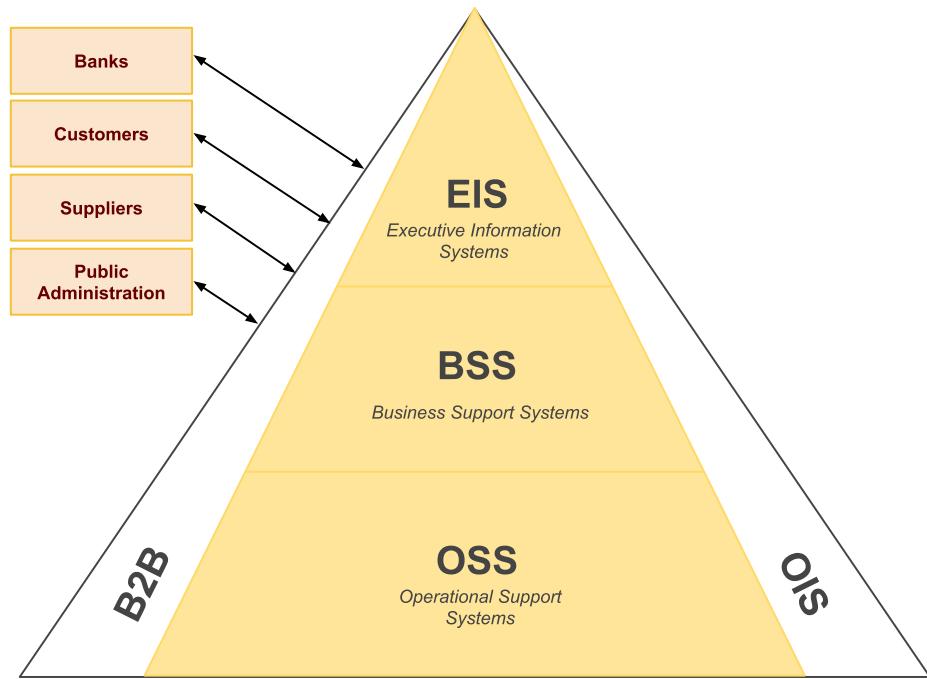

Enterprise Architecture

Enterprise Architecture Levels

- Defines a structure of an enterprise system
 - Abstracts from data, functions, processes, software, hardware
 - divides enterprise system into functional blocks – **applications**
 - Order Management System (*OMS*)
 - Customer Relationship System (*CRM*)
 - Billing and Revenue Management (*BRM*)
 - applications correspond to **domains** such as sales, finance, procurement, production, etc.
- Enterprise architecture levels
 - Operational Support Systems (*OSS*)
 - Business Support System (*BSS*)
 - Executive Information Systems (*EIS*)
 - Office Information Systems (*OIS*)
 - Integration
 - Business-to-Business (*B2B*)
 - Enterprise Application Integration (*EAI*)

Enterprise Architecture Representation

Organization Types in Enterprise Systems

- **Customer Organization**
 - **Primary need:** Business process automation and optimization
 - **Responsibilities:** Define business requirements, acceptance criteria, change management
 - **Key roles:** Enterprise architect, business analysts, end users, IT administrators
 - **Example:** Bank implementing new CRM system for customer management
- **Supplier Organization (System Integrator)**
 - **Primary need:** Deliver tailored solutions meeting customer requirements
 - **Responsibilities:** Solution design, customization, implementation, support
 - **Key roles:** Solution architects, technical architects, developers, project managers
 - **Example:** Accenture implementing SAP for manufacturing company
- **Vendor Organization (Technology Provider)**
 - **Primary need:** Develop market-driven products and platforms
 - **Responsibilities:** Product roadmap, R&D, platform maintenance, market analysis
 - **Key roles:** Product managers, platform architects, developers, DevOps engineers
 - **Example:** Microsoft developing Azure cloud services

Architect Roles and Responsibilities

- **Enterprise Architect**
 - **Scope:** Organization-wide architecture strategy and governance
 - **Focus:** Business-IT alignment, application portfolio, data architecture
 - **Deliverables:** Enterprise architecture blueprints, technology roadmaps
 - **Standards:** TOGAF, industry-specific (eTOM for telecom)
- **Solution Architect**
 - **Scope:** End-to-end solution design for specific business problems
 - **Focus:** Requirements analysis, system integration, functional design
 - **Deliverables:** Solution design documents, integration patterns, data flows
 - **Skills:** Business analysis, system design, stakeholder management
- **Technical Architect**
 - **Scope:** Technology implementation and infrastructure design
 - **Focus:** Performance, scalability, security, technology selection
 - **Deliverables:** Technical specifications, deployment guides, performance benchmarks
 - **Skills:** Deep technical expertise, cloud platforms, DevOps practices

Modern Technical Architect Roles

- **Cloud Architect**
 - Cloud-native solutions, migration strategies, multi-cloud designs
 - AWS, Azure, GCP certifications and expertise
- **Security Architect**
 - Zero-trust architecture, compliance frameworks (GDPR, SOX)
 - Identity management, encryption, threat modeling
- **Data Architect**
 - Data lakes, data warehouses, real-time analytics
 - Data governance, privacy, master data management
- **API Architect**
 - API strategy, microservices design, API governance
 - REST, GraphQL, event-driven architectures
- **DevOps Architect**
 - CI/CD pipelines, infrastructure as code, monitoring
 - Kubernetes, containerization, observability platforms

Overview

- Architecture Overview
- Software Architecture
 - *Types, Separation of Concerns, Interface*
 - *Client/Server Architectures*

Software Architecture Types

- Centralized – Client/Server (C/S)
 - *Central server; a bunch of clients*
 - *monolithic, two-, three-, multi-tier architectures*
 - *Single point of failure!*
 - *when a server fails the whole system fails*
 - *need for a scalable and **highly reliable** server-side solutions*
 - *Enterprise systems (mostly) use centralized solutions*
 - *But, enhanced with peer-to-peer principles*
- Decentralized – Peer-to-Peer (P2P)
 - *Reliability*
 - *when a node fails, other nodes take up its function*
 - *Scalability*
 - *multiple nodes can share the load*
 - *such as messaging systems in enterprise systems*

Separation of Concerns

- Separation of Concerns
 - also called Separation of Layers
 - Concern – any piece of interest (part) in the application
 - concerns should overlap in functionality as little as possible
 - Basic application concerns: data manipulation, data integrity, application logic, user-interactions
 - Software architecture separates concerns into layers
 - presentation, application, data
- Interface
 - ~ agreement on "how layers should communicate"
 - most important artifact in Separation of Concerns
 - If an interface is in place, application development and innovation can happen **independently** at each layer

Interface

- Definition
 - Agreement (contract) between two or more layers during communication
- May be achieved by
 - Through standards (accepted or enforced),
 - Through a social agreement during design
 - A dominant position of a technology on the market
- Interface includes subsets of domain architectures
 - Subsets that are subject to communication between layers
 - **data** – defines communication language (syntax, semantics),
 - **functions** – defines entry points (operations),
 - **processes** – defines valid states and transitions between them
 - **technical details** – protocols, ports, IP addresses, etc.

Interface Example: REST API

- **Data** interface: JSON format
- **Function** interface: HTTP methods
 - *GET /customers/{id}* - retrieve customer
 - *POST /customers* - create customer
 - *PUT /customers/{id}* - update customer
- **Process** interface: state transitions
- **Technical** interface: HTTPS, port 443, authentication

Overview

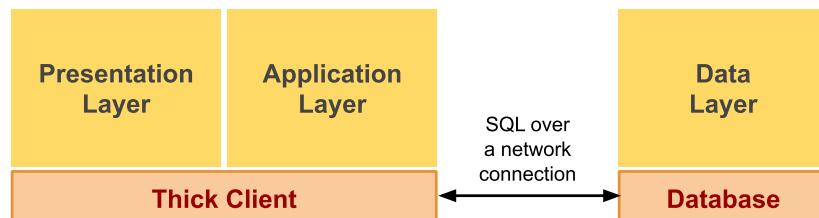

- Architecture Overview
- Software Architecture
 - *Types, Separation of Concerns, Interface*
 - *Client/Server Architectures*

Monolithic Architecture

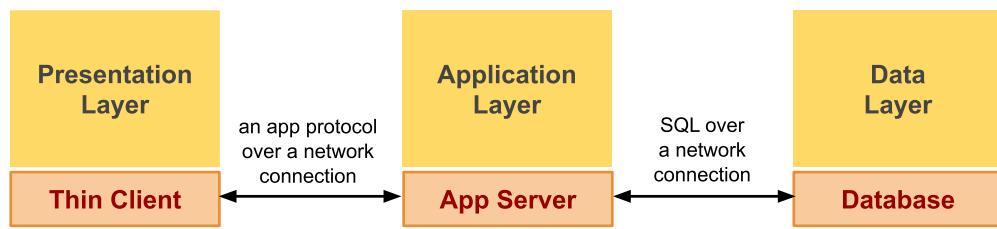

- All layers on a single machine
 - usually non-portable apps; specific OS
 - first types of computer systems, typical for 90-ties
 - single-user only; standalone apps, minimal integration
 - technologies: third-gen programming languages, local storage systems
- Drawbacks
 - hard to maintain (updates, distribution of new versions)
 - data security issues
 - performance and scalability issues

Two-tier Client/Server Architecture

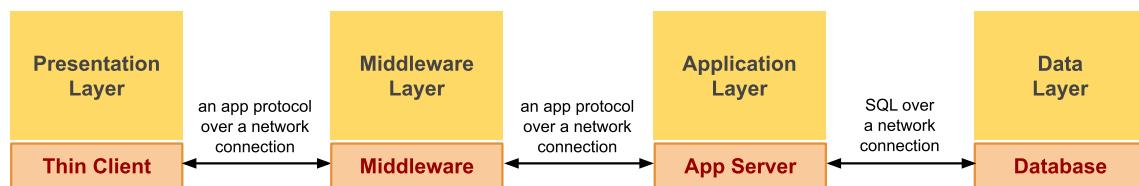

- Presentation and app layers separated with data
 - Thick client – desktop application, OS-dependent
 - Data on a separate server (DBMS)
 - Multi-user system, all sharing a database
 - Storage system of high performance, transactions support
 - SQL technology; native OS desktop application
- Drawbacks
 - Thick client hard to maintain (reinstallation with every update)
 - No app logic sharing (only through copies)
 - Data-oriented integration (integrity in the app logic!)

Three-tier Client/Server Architecture

- All layers on separated machines
 - *Thin client – desktop application or interpreted code*
 - *Multi-user system, all sharing app logic and a database*
 - *App server of high performance, scalability*
- Drawbacks
 - *Spaghetti integration*
 - *Limited, single app server scalability*

Multi-tier Client/Server Architecture

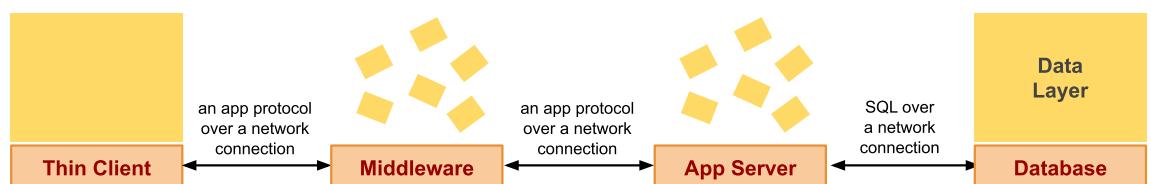

- Additional middleware layer
 - *provides value-added services for communications*
 - *individual servers or a compact solution (e.g., Enterprise Service Bus)*
- Drawbacks
 - *Monolithic apps are difficult to scale as a whole*
 - *Deployment overhead*
 - *A single technological environment for all app functions in the monolith*

Client/Server Architecture (microservices)

- Microservice architecture
 - *Middleware, app and DB monoliths are microservice architecture*
 - *Improved scalability and technology neutrality of app components*
- Service orchestration layer
 - *Kubernetes (K8s)*
 - *Large K8s cluster for all, middleware, app, DB*
 - *Separate K8s cluster*

Client/Server Architecture (microservices)

- Not-a-microservice Architecture
 - *Monoliths deployed to Kubernetes cluster*
 - *Improved Deployments (via container images)*
 - *Improved fail-over*
 - *Not cheaper (Kubernetes costs come into play)*

Types of Middleware

- Scalability
 - They help to achieve high performance through better scalability
 - Messaging Servers (message queues, publish/subscribe)
 - Load Balancers
 - Proxy servers, reverse proxy
- Functional
 - They help to achieve more flexible integration
 - Process servers
 - Repositories, registries of services/components
 - Mediators – data interoperability, process interoperability, technical interoperability (SOAP server)
 - Monitors for analytics of apps usages
- Security
 - Firewalls, Gateways, ...
