### **Overview**

- Service Definition
- Integrating Applications
- Integration Patterns
- Microservices Architecture

#### **Service Views**

#### Business view

A service realizes an effect that brings a business value to a service consumer
 → for example, to pay for and deliver a book

#### Conceptual view

 encapsulation, reusability, loose coupling, contracting, abstraction, discoverability, composability

#### Logical view

- service interface, description and implementation
- message-oriented and resource-oriented

#### • Software architecture view

- business service (also application service)
  - → external, exposed functionality of an application
- middleware service
  - → internal/technical, supports processing of requests

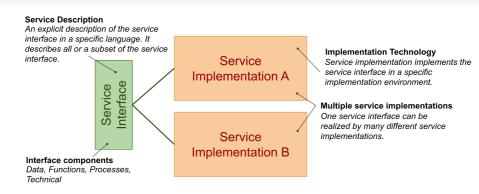

#### • Technology architecture view

- REST/RESTful, GraphQL
- XML-RPC/SOAP, RMI, gRPC
- WohSacket WohRTC SSF

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

- 3 -

## Interface, Description and Implementation

### Terminology clarification

- service ~ service interface + service implementation
- WSDL service ~ service description in WSDL language
- SOAP service ~ a service interface is possible to access through SOAP protocol; there is a WSDL description usually available too.
- REST/RESTful service ~ service interface that conforms to REST architectural style and HTTP protocol
- Microservice ~ a set of services that realize an app's capability

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

### **Service Interface**

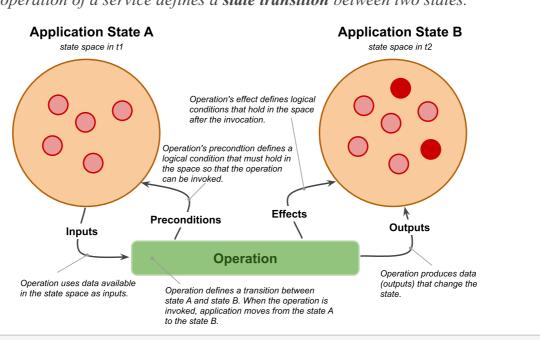

- Service interface components
  - Data
    - → Data model definition used by the service
    - $\rightarrow$  for example, input and output messages, representation of resources
  - Functions
    - → operations and input and output data used by operations
  - Process
    - $\rightarrow$  public process: how to consume the service's functionality
  - Technical
    - → security, usage aspects (SLA-Service Level Agreement)
    - $\rightarrow$  other technical details such as IP addresses, ports, protocols, etc.

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

- 5 -

### **Public Process**

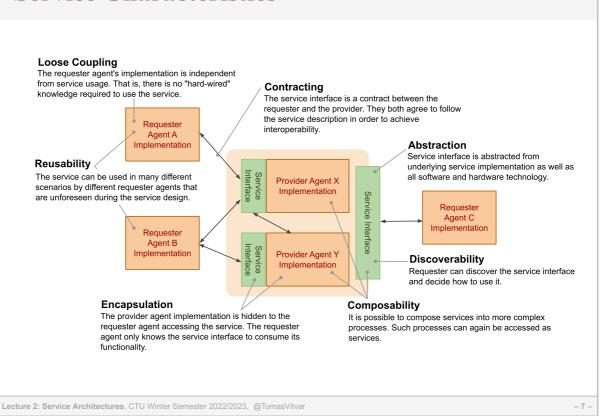

- A state diagram
  - operation of a service defines a **state transition** between two states.

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

- 6 -

### **Service Characteristics**

### **Overview**

- Service Definition
- Integrating Applications
- Integration Patterns
- Microservices Architecture

### **Integration and Interoperability**

### Integration

- A process of connecting applications so that they can exchange and share capabilities, that is information and functionalities.
- Includes methodological approaches as well as technologies

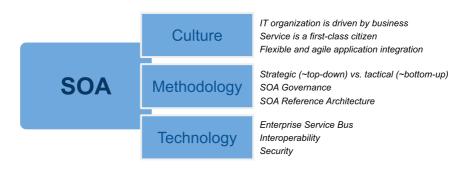

### Interoperability

- Ability of two or more applications to understand each other
- Interoperability levels
  - → Data syntax/structure and semantics
  - → Functions/Processes syntax and semantics
  - $\rightarrow$  Technical aspects protocols, network addresses, etc.

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

- 9 -

#### **Service Oriented Architecture**

#### SOA supports two core business strategies

- Growing top-line revenue
  - → Enterprise reacts quickly to requirements from the market
  - → Business processes can be reconfigured rather than reimplemented
- Improving bottom-line profit
  - → Saving development costs by resuing existing services

### Pre-integrated solutions

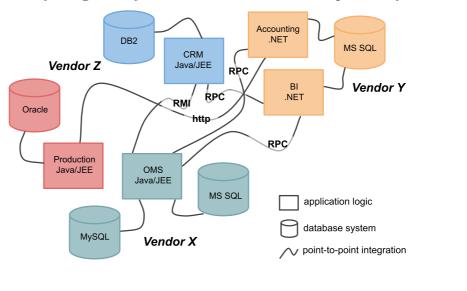

- Out-of-the-box applications and integration solutions among them

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

– 10 –

### **One-to-One Service Integration**

- Direct integration of applications
  - Multiple protocols problem, multiple vendor problem
  - Replication of integration functionalities such as interoperability solutions

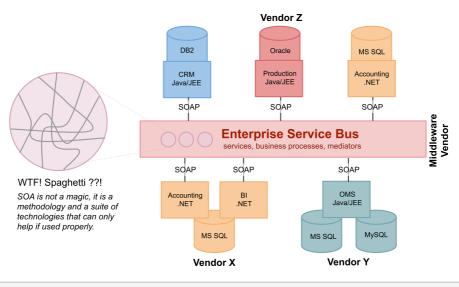

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

- 11 -

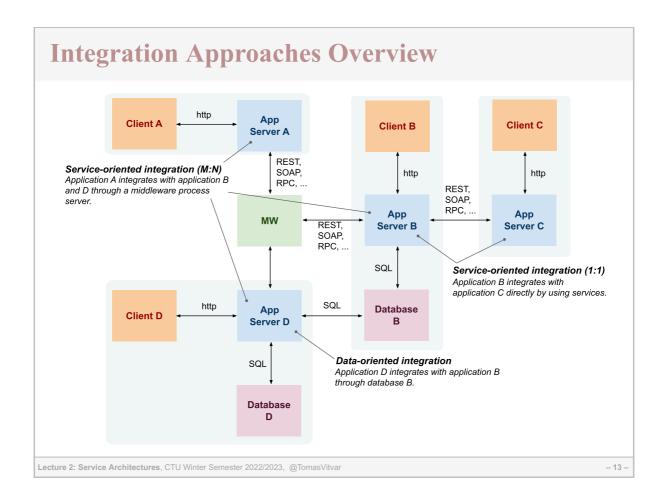

# **Many-to-Many Service Integration**

- Enterprise Service Bus central integration technology
  - Realizes so called Service Oriented Architecture (SOA)
  - Contains various integration components such as process server, mediators, messaging middleware, identity management, etc.

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

\_ 12

# **Data-oriented Integration**

#### • Third-party database access

- Application D accesses a database of application B directly by using SQL and a knowledge of database B structure and constraints
- In the past: monolithic and two-tier client/server architectures
- Today: ETL (Extract, Transform, Load) technologies

#### Problems

- App D must understand complex structures and constraints
  - → Data very complex, includes structure and integrity constraints
  - → Functions/processes hidden in integrity constraints
  - → Technical access mechanisms can vary

## **Service-oriented Integration**

- Integration at the application layer
  - Application exposes services that other applications consume
  - Services hide implementation details but only define interfaces for integration
- Problems
  - Can become unmanageable if not properly designed
  - Interoperability
    - → Data limited to input and output messages only
    - → Functions/processes limited to semantics of services
    - → Technical access mechanisms can vary

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

- 15

## **Integration and Types of Data**

- Real-time data Web services
  - Service-oriented integration
  - online, realtime communication between a client and a service
  - Usually small data and small amount of service invocation in a process
- Bulk data ETL
  - Data-oriented integration
  - processing of large amount of data in batches
  - Sometimes required for reconciliation across apps
    - → when real-time integration fails and there is poor error handling
- SOA provides both Web service and ETL capabilities

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

### **Enterprise Service Bus**

- ESB is a central intermediary in SOA
  - Types of services: shared and infrastructure
  - Types of processes: Technical and Business
- ESB Application
  - Application running on an application server
  - Exposes functionality via Web service interface
  - Allows to communicate with various messaging protocols
- Middlware Integration Patterns
  - Technical-level interoperability message broker
  - Location transparency
  - Dynamic routing
  - Session pooling
  - Message enrichment
  - Data transformation
  - Key mapping

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

\_ 17 -

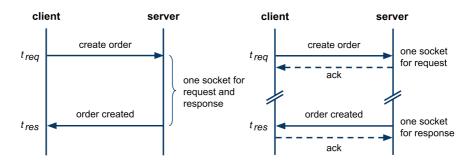

#### **Overview**

- Service Definition
- Integrating Applications
- Integration Patterns
  - Synchronous and Asynchronous Integration
  - Middleware Integration Patterns
- Microservices Architecture

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

\_ 18 -

## **Synchronous and Asynchronous Integration**

#### Synchronous

- one socket,  $|t_{reg} t_{res}|$  is small
- easy to implement and deploy, only standard firewall config
- only the server defines endpoint

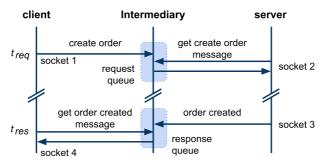

#### Asynchronous

- request, response each has socket, client and server define endpoints
- $-|t_{reg}-t_{res}|$  can be large (hours, even days)
- harder to do across network elements (private/public networks issue)

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

- 19 -

# Asynchronous via Intermediary

### Intermediary

- A component that decouples a client-server communication
- It increases reliability and performance
  - $\rightarrow$  The server may not be available when a client sends a request
  - $\rightarrow$  There can be multiple servers that can handle the request

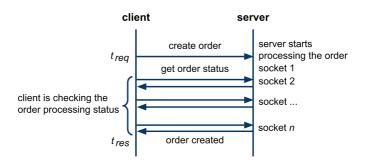

### Further Concepts

- Message Queues (MQ) queue-based communication
- Publish/Subscribe (P/S) event-driven communication

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

– 20 –

## **Asynchronous via Polling**

- Polling only clients open sockets
  - A client performs multiple request-response interactions
    - $\rightarrow$  The first interaction initiates a process on the server
    - → Subsequent interactions check for the processing status
    - → The last interaction retrieves the processing result
- Properties of environments
  - A server cannot open a socket with the client (network restrictions)
  - Typically on the Web (a client runs in a browser)

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

- 21 -

#### **Overview**

- Service Definition
- Integrating Applications
- Integration Patterns
  - Synchronous and Asynchronous Integration
  - Middleware Integration Patterns
- Microservices Architecture

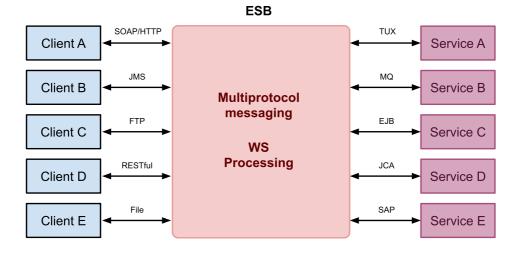

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

– 22 -

## **Message Broker**

### • Message broker

- ESB can mix and match transports both standard and proprietary

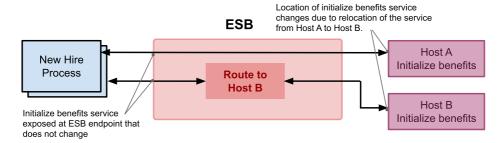

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

- 23 -

# **Location Transparency**

- Location transparency
  - ESB can hide changes in location of services
  - Such changes will not affect clients
  - Can also be used for load balancing for multiple service instances

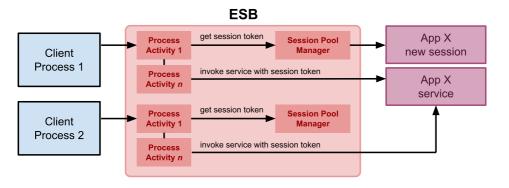

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

### **Session Pooling**

### • Session Pooling

- ESB can maintain a pool of connections (session tokens) to a back-end app when creating a new connection is expensive
- A single session token can be reused by multiple instances of business processes

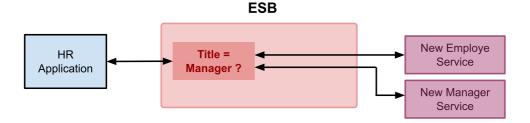

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

- 25 -

# **Dynamic Routing**

## • Dynamic routing

- ESB exposes a service that routes to various back-end services based on message contents.

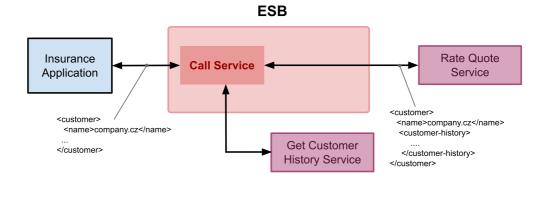

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

### **Message Enrichment**

### • Message enrichmenet

- Enriches a message before invoking back-end application service.

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

– 27 –

### **Data Transformation**

- Data transformation phases:
  - Definition of mapping and execution of mappings
- Definition of mappings (design-time)
  - A mapping associates one data structure to another data structure and defines a conversion between them.
  - Mapping languages
    - → graphical for design that translates to XSLT, XQuery
    - $\rightarrow$  Sometimes implemented in 3rd gen. languages (e.g., Java)
- Execution of mappings (runtime)
  - application of mappings to instance data
- CDM terminology
  - Application Business Message back-end app format
  - Enterprise Business Message CDM format

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

### **Key Mapping**

#### • What is key mapping

- -Key = identifier of en entity in a back-end application
- Key Mapping = a mapping of an ID of an entity in one system to an ID of the same entity in another system.
- Key mapping is realized using universal IDs (UID)

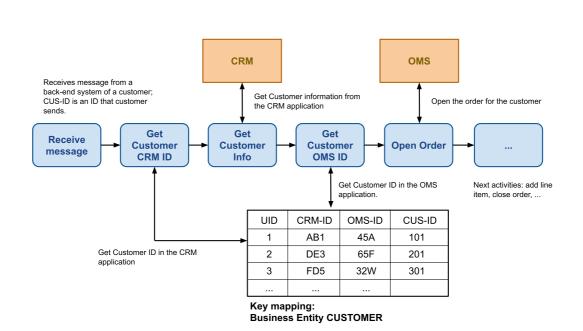

#### • Example

- A customer MOON exists in CRM and OMS systems
- In CRM system, MOON has an CRM-ID=AB1
- In OMS system, MOON has an CRM-ID=45A
- Key mappig allows to map the CRM-ID AB1 to the OMS-ID 45A
- Key mapping is a table
  CRM-ID → UID → OMS-ID

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

- 29 -

# **Key Mapping Example**

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

– 30 –

### **Overview**

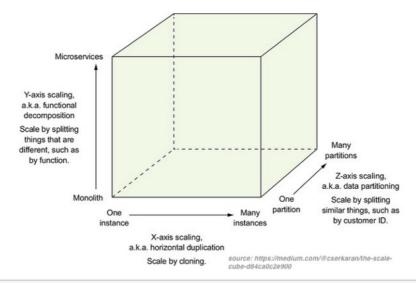

- Service Definition
- Integrating Applications
- Integration Patterns
- Microservices Architecture

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

- 31 -

### The Scale Cube

- Three-dimensional scalability model
  - X-Axis scaling requests across multiple instances
  - Y-Axis scaling decomposes an application into micro-services
  - Z-Axis scaling requests across "data partitioned" instances

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

- 32 -

#### Overview

- Emerging software architecture
  - monolithic vs. decoupled applications
  - applications as independenly deployable services

A monolithic application puts all its functionality into a single process...

A microservices architecture puts each element of functionality into a separate service...

... and scales by replicating the monolith on multiple servers

... and scales by distributing these services across servers, replicating as needed.

Lecture 2: Service Architectures, CTU Winter Semester 2022/2023, @TomasVitvar

- 33 -

## **Major Characteristics**

- Loosely coupled
  - Integrated using well-defined interfaces
- Technology-agnostic protocols
  - HTTP, they use REST architecture
- Independently deployable and easy to replace
  - A change in small part requires to redeploy only that part
- Organized around capabilities
  - such as accounting, billing, recommendation, etc.
- Impplemented using different technologies
  - polyglot programming languages, databases
- Owned by a small team
