## **Overview**

- Service Definition
- Integrating Applications
- Integration Patterns

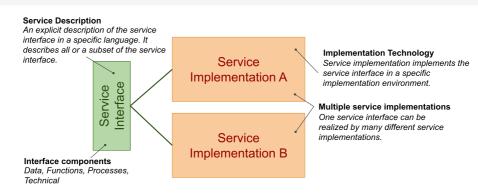

## **Service Views**

- Business view
  - A service realizes an effect that brings a business value to a service consumer
     → for example, to pay for and deliver a book
- Conceptual view
  - reusability, loose coupling, contracting, discoverability
- Logical view
  - service interface, description and implementation
  - RPC-style and resource-oriented
- Software architecture view
  - business service (also application service)
    - → external, exposed functionality of an application
  - middleware service
    - → internal/technical, supports processing of requests
- Technology architecture view
  - REST/RESTful, GraphQL
  - XML-RPC/SOAP, RMI, gRPC
  - WebSocket, WebRTC, SSE

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

# Interface, Description and Implementation

## Terminology clarification

- service ~ service interface + service implementation
- REST/RESTful service ~ service interface that conforms to REST architectural style and HTTP protocol
- Microservice ~ a set of services that realize an app's capability
- Kubernetes service ~ a service that routes traffic to a set of pods

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

- 4

## **Service Interface**

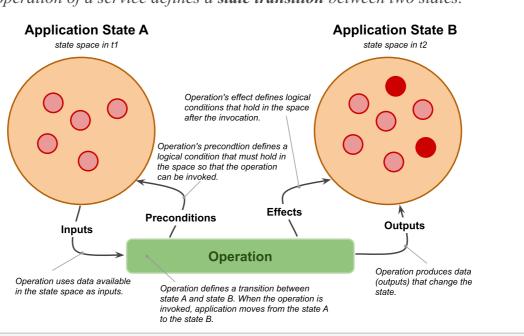

- Service interface components
  - Data
    - → Data model definition used by the service
    - → for example, input and output messages, representation of resources
  - Functions
    - → operations and input and output data used by operations
  - Process
    - $\rightarrow$  public process: how to consume the service's functionality
  - Technical
    - → security, usage aspects (SLA-Service Level Agreement)
    - $\rightarrow$  other technical details such as IP addresses, ports, protocols, etc.

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

- 5 -

## **Public Process**

- A state diagram
  - operation of a service defines a **state transition** between two states.

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

# **Service Characteristics**

#### **Loose Coupling** The requester agent's implementation is independent from service usage. That is, there is no "hard-wired" Contracting knowledge required to use the service. The service interface is a contract between the requester and the provider. They both agree to follow the service description in order to achieve Requester interoperability. Agent A Implementation Reusability The service can be used in many different scenarios by different requester agents that Provider Agent X Implementation Service Interface are unforeseen during the service design. Requester Agent C Implementation Requester Agent B Implementation Provider Agent Y Discoverability Implementation Requester can discover the service interface and decide how to use it.

## **Overview**

- Service Definition
- Integrating Applications

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

Integration Patterns

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

- 8

## **Integration and Interoperability**

## Integration

- A process of connecting applications so that they can exchange and share capabilities, that is information and functionalities.
- Includes methodological approaches as well as technologies

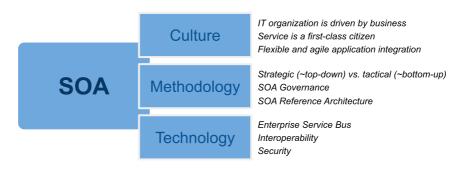

## Interoperability

- Ability of two or more applications to understand each other
- Interoperability levels
  - → Data syntax/structure and semantics
  - → Functions/Processes syntax and semantics
  - $\rightarrow$  Technical aspects protocols, network addresses, etc.

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

- 9 -

## **Service Oriented Architecture**

## SOA supports two core business strategies

- Growing top-line revenue
  - → Enterprise reacts quickly to requirements from the market
  - → Business processes can be reconfigured rather than reimplemented
- Improving bottom-line profit
  - → Saving development costs by resuing existing services

## Pre-integrated solutions

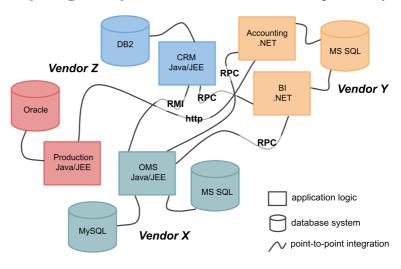

- Out-of-the-box applications and integration solutions among them

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

– 10 –

## **One-to-One Service Integration**

- Direct integration of applications
  - Multiple protocols problem, multiple vendor problem
  - Replication of integration functionalities such as interoperability solutions

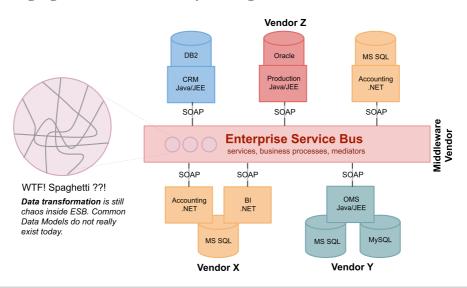

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

- 11 -

# **Many-to-Many Service Integration**

- Enterprise Service Bus central integration technology
  - Realizes so called Service Oriented Architecture (SOA)
  - Contains various integration components such as process server, mediators, messaging middleware, identity management, etc.

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

– 12 -

#### **Integration Approaches Overview** http App Client A Client B Client C Server A REST, Service-oriented integration (M:N) SOAP, http http Application A integrates with application B RPC, ... and D through a middleware process REST SOAP RPC, App App Server B Server C SOAP, RPC, .. SQL Service-oriented integration (1:1) Application B integrates with application C directly by using services. SQL Database App Client D Server D Data-oriented integration SQL Application D integrates with application B through database B. **Database**

# **Data-oriented Integration**

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

## • Third-party database access

- Application D accesses a database of application B directly by using SQL and a knowledge of database B structure and constraints
- In the past: monolithic and two-tier client/server architectures
- Today: ETL (Extract, Transform, Load) technologies

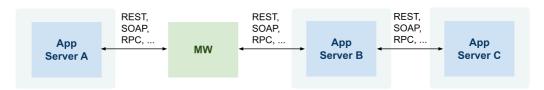

#### Problems

- App D must understand complex structures and constraints
  - → Data very complex, includes structure and integrity constraints
  - → Functions/processes hidden in integrity constraints
  - → Technical access mechanisms can vary

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

– 14 -

# **Service-oriented Integration**

- Integration at the application layer
  - Application exposes services that other applications consume
  - Services hide implementation details but only define interfaces for integration
- Problems
  - Can become unmanageable if not properly designed
  - Interoperability
    - → Data limited to input and output messages only
    - → Functions/processes limited to semantics of services
    - → Technical access mechanisms can vary

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

- 15

# **Integration and Types of Data**

- Real-time data Web services
  - Service-oriented integration
  - online, realtime communication between a client and a service
  - Usually small data and small amount of service invocation in a process
- Bulk data ETL
  - Data-oriented integration
  - processing of large amount of data in batches
  - Sometimes required for reconciliation across apps
    - → when real-time integration fails and there is poor error handling
- SOA provides both Web service and ETL capabilities

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

- 16

## **Enterprise Service Bus**

- ESB is a central intermediary in SOA
  - Types of services: shared and infrastructure
  - Types of processes: Technical and Business
- ESB Application
  - Application running on an application server
  - Exposes functionality via Web service interface
  - Allows to communicate with various messaging protocols
- Middlware Integration Patterns
  - Technical-level interoperability message broker
  - Location transparency
  - Dynamic routing
  - Session pooling
  - Message enrichment
  - Data transformation
  - Key mapping

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

\_ 17 \_

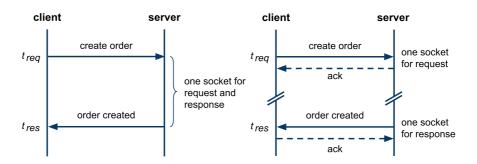

## **Overview**

- Service Definition
- Integrating Applications
- Integration Patterns
  - Synchronous and Asynchronous Integration
  - Microservices Architecture

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

– 18 –

# **Synchronous and Asynchronous Integration**

## Synchronous

- one socket,  $|t_{reg} t_{res}|$  is small
- easy to implement and deploy, only standard firewall config
- only the server defines endpoint

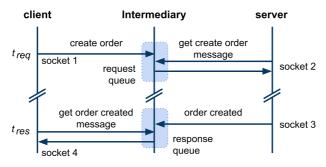

#### Asynchronous

- request, response each has socket, client and server define endpoints
- $-|t_{reg}-t_{res}|$  can be large (hours, even days)
- harder to do across network elements (private/public networks issue)

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

- 19 -

# Asynchronous via Intermediary

## Intermediary

- A component that decouples a client-server communication
- It increases reliability and performance
  - $\rightarrow$  The server may not be available when a client sends a request
  - $\rightarrow$  There can be multiple servers that can handle the request

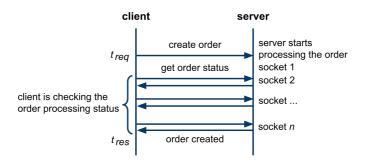

## Further Concepts

- Message Queues (MQ) queue-based communication
- Publish/Subscribe (P/S) event-driven communication

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitva

– 20 –

# Asynchronous via Polling

- Polling only clients open sockets
  - A client performs multiple request-response interactions
    - $\rightarrow$  The first interaction initiates a process on the server
    - → Subsequent interactions check for the processing status
    - $\rightarrow$  The last interaction retrieves the processing result
- Properties of environments
  - A server cannot open a socket with the client (network restrictions)
  - Typically on the Web (a client runs in a browser)

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

- 21 -

## **Overview**

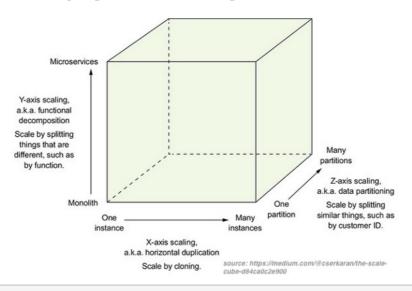

- Service Definition
- Integrating Applications
- Integration Patterns
  - Synchronous and Asynchronous Integration
  - Microservices Architecture

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

– 22 -

### The Scale Cube

- Three-dimensional scalability model
  - X-Axis scaling requests across multiple instances
  - Y-Axis scaling decomposes an application into micro-services
  - Z-Axis scaling requests across "data partitioned" instances

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

- 23 -

## **Overview**

- Emerging software architecture
  - monolithic vs. decoupled applications
  - applications as independenly deployable services

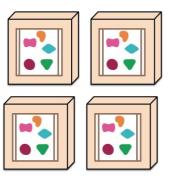

A monolithic application puts all its functionality into a single process...

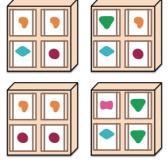

A microservices architecture puts each element of functionality into a separate service...

... and scales by replicating the monolith on multiple servers

... and scales by distributing these services across servers, replicating as needed.

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar

- 24 -

# **Major Characteristics**

- Loosely coupled
  - Integrated using well-defined interfaces
- Technology-agnostic protocols
  - HTTP, they use REST architecture
- Independently deployable and easy to replace
  - A change in small part requires to redeploy only that part
- Organized around capabilities
  - such as accounting, billing, recommendation, etc.
- Impplemented using different technologies
  - polyglot programming languages, databases
- Owned by a small team

Lecture 2: Service Architecture, CTU Winter Semester 2025/2026, @TomasVitvar
