Overview

- SOAP
 - Message Path
- Representational State Transfer
- SOAP and REST Comparision

Web Service Architecture

• WSDL, SOAP and UDDI

- Realization of SOA
- Message-Oriented view
 - → SOAP messaging (header, body)
 - → types of messages input, output, fault

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

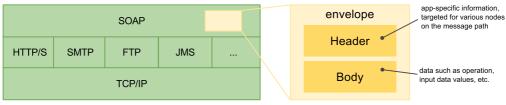

- 3 -

SOAP Protocol

• SOAP defines a messaging framework

SOAP Protocol Stack

SOAP Message

- XML-based protocol
- a layer over transport protocols
 - \rightarrow binding to HTTP, SMTP, JMS, ...
- involves multiple nodes (message path)
 - \rightarrow sender, receiver, intermediary

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

- 4

SOAP Message

Envelope

- A container of a message

Header

- Metadata describe a message, organized in header blocks
 - \rightarrow routing information
 - → security measures implemented in the message
 - → reliability rules related to delivery of the message
 - → context and transaction management
 - → correlation information (request and response message relation)
- WS extensions (WS-*) utilize the message header

• Body (payload)

- Actual contents of the message, XML formatted
- Contains also faults for exception handling

Attachment

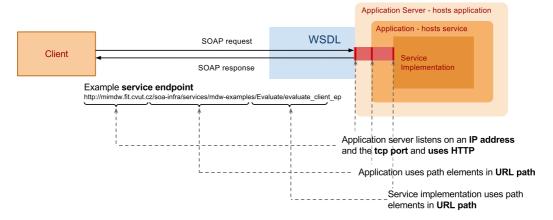

- Data that cannot be serialized into XML such as binary data

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

- 5 -

Endpoint

• SOAP service endpoint definition

- − *Endpoint* − *a network address used for communication*
- Communication request-response, SOAP messages over a communication (application) protocol
- Synchronous communication only service defines endpoint
- Asynchronous communication service and client define endpoints

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

- 6

Service Invocation Example (1)

- Example service implementation
 - A service that evaluates an expression
 - Uses SOAP over HTTP
 - → We can use standard HTTP tools to invoke the service
- SOAP request message

```
evaluate-input.xml
```

Invoking the service using curl

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

-7-

Service Invocation Example (2)

Invocation result

```
* About to connect() to mimdw.fit.cvut.cz port 80 (#0)
        Trying 147.32.233.55... connected
    * Connected to sb.vitvar.com (147.32.233.55) port 80 (#0)
    > POST /soa-infra/services/mdw-examples/Evaluate/evaluate_client_ep_HTTP/1.1
    > User-Agent: curl/7.19.7 (x86_64-redhat-linux-gnu) libcurl/7.19.7 NSS/3.14.0.
    > Host: mimdw.fit.cvut.cz
    > Accept: */*
    > Content-Type: text/xml;charset=UTF-8
> SOAPAction: "evaluate"
9
10
    > Content-Length: 302
    } [data not shown]
12
    13
15
    < Server: Oracle-Application-Server-11g</pre>
    < Content-Length: 569
    < X-ORACLE-DMŠ-ECID: 004upqiWhdD0zkWVLybQ8A0005uX0004Y^
18
    < SOAPAction: "
    < X-Powered-By: Servlet/2.5 JSP/2.1
    < Content-Type: text/xml; charset=UTF-8
    < Content-Language: en
```

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

Service Invocation Example (3)

SOAP response message

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

- 9 -

Client Implementation

- WSDL Web Service Description Language
 - definitions for the client to know how to communicate with the service
 - → which operations it can use
 - → data formats for input (request), output (response) and fault messages
 - → how to serialize the data as payloads of a communication protocol (binding)
 - \rightarrow where the service is physically present on the network
- Clients' environments
 - Clients implemented in a language such as Java
 - → Tools to generate service API for the client, e.g. WSDL2Java
 - → Can be written manually too, e.g. our example in bash
 - Clients reside on the middleware, e.g. on an Enterprise Service Bus
 - → They provide added values in end-to-end communication, proxy services, SOAP intermediaries

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

– 10 –

Overview

- SOAP
 - Message Path
- Representational State Transfer
- SOAP and REST Comparision

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

_ 11 _

SOAP Node

- A program that services use to transmit SOAP messages
 - Element of SOAP messaging infrastructure
 - Realized by a SOAP communication server
 - \rightarrow Every vendor has its own implementation
 - → Must conform to SOAP standard
 - → Sometimes causes vendor interoperability problem
- SOAP node types
 - SOAP sender a node that transmits a message
 - SOAP receiver a node that received a message
 - SOAP intermediary a node that receives and transmits a message and optionally processes the message
 - initial SOAP sender the first node transmitting the message
 - ultimate SOAP receiver the last node receiving the message

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

– 12 -

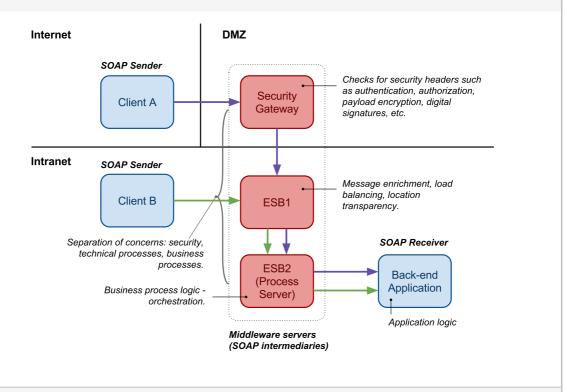

Message Path

- A path from a service requester to a service consumer over a number of SOAP nodes.
 - $S \rightarrow (I)^* \rightarrow R$, where
 - S is an initial sender,
 - I is an intermediary,
 - R is an ultimate receiver.
- A path may have zero or more intermediaries
 - Passive intermediary such as a load balancing server
 - → only forwards the message, does not rewrite headers
 - Active intermediary such as a policy enforcement server
 - \rightarrow May modify headers

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

- 13 -

SOAP Message Paths Example

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

– 14 -

SOAP Message Example 1

- Client $A \rightarrow$ Security Gateway
 - Client needs to authenticate with a username and a password

```
xmlns:tns="http://company.com/2011/wsdl/order"
        xmlns:s="http://schemas.xmlsoap.org/soap/envelope/">
4
      <s:header>
        <wss:security</pre>
             xmlns:wss="http://schemas.xmlsoap.org/ws/2002/04/secext"
6
             s:mustUnderstand="1">
          <wss:UsernameToken>
9
           <wss:username>username</wsse:Username>
            <wss:password Type="#PasswordText">pswd</wsse:Password>
11
          </wss:UsernameToken>
        </wss:security>
12
     </s:header>
13
14
      <tns:getOrderStatus xmlns:m="http://company.com/2011/schemas/order">
15
            <m:orderId>2345</m:orderId>
16
17
            <m:customerId>2234</m:customerId>
18
        </tns:getOrderStatus>
19
      </s:body>
20 </s:envelope>
```

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

- 15 -

SOAP Message Example 2

- Client $B \rightarrow Proxy Server$
 - Client directly invokes a proxy service without authentication

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

– 16 -

Overview

- SOAP
- Representational State Transfer
- SOAP and REST Comparision

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

_ 17 _

REST

- REST
 - Representational State Transfer
- Architecture Style
 - Roy Fielding co-author of HTTP
 - He coined REST in his PhD thesis ♥.
 - → The thesis abstracts from HTTP technical details
 - \rightarrow HTTP is one of the REST implementation \rightarrow **RESTful**
 - → REST is a leading programming model for Web APIs
- REST (RESTful) proper design
 - people break principles often
 - See REST Anti-Patterns

 desired for some details.
- REST and Web Service Architecture
 - REST is a realization of WSA resource-oriented model

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

– 18 –

REST Core Principles

- REST architectural style defines constraints
 - if you follow them, they help you to achieve a good design, interoperability and scalability.
- Constraints
 - Client/Server
 - Statelessness
 - Cacheability
 - Layered system
 - Uniform interface
- Guiding principles
 - Identification of resources
 - Representations of resources and self-descriptive messages
 - Hypermedia as the engine of application state (HATEOAS)

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

_ 19 _

Resource

- A resource can be anything such as
 - A real object: car, dog, Web page, printed document
 - An abstract thing such as address, name, etc. \rightarrow RDF
- A resource in REST
 - A resource corresponds to one or more entities of a data model
 - A representation of a resource can be conveyed in a message electronically (information resource)
 - A resource has an identifier (URI) and a representation (XML, JSON, ...) and a client can apply an access to it (use HTTP methods)

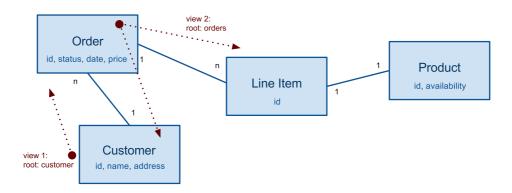

http://www.company.com/tomas/orders Representation Resource Metadata: ... Data: ... Orders

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

- 20

Resources over Entities

- Application's data model
 - Entities and properties that the app uses for its data

- URI identifies a resource within the app's data model
 - path a "view" on the data model
 - \rightarrow data model is a graph
 - → URI identifies a resource using a path in a tree with some root

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

- 21 -

Examples of Views

- View 1
 - all customers: /customers
 - a particular customer: /customers/{customer-id}
 - All orders of a customer: /customers/{customer-id}/orders
 - A particular order: /customers/{customer-id}/orders/{order-id}
- View 2
 - all orders: /orders
 - All orders of a customer: /orders/{customer-id}
 - A particular order: /orders/{customer-id}/{order-id}
- Various views represented by URL path

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

– 22 -

Uniform Interface

- Finite set of operations
 - They are not dependent on the domain semantics
 - They only define how to manipulate with resources
- RESTful service HTTP methods
 - GET reads a resource (+ HEAD, OPTIONS)
 - PUT updates or creates a resource (+ PATCH)
 - POST creates a new resource
 - DELETE deletes a resource
- HTTP methods' properties
 - a method is safe
 - → *It does not change the application state (it does not modify the data)*
 - → GET, OPTIONS, HEAD
 - → Results can be cached by intermediaries (e.g. proxy servers)
 - a method is **idempotent**
 - \rightarrow Every method invocation will always have the same effect
 - \rightarrow GET, PUT, DELETE

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

- 23 -

Examples

- Operation getCustomerOrder(customerId, OrderId)
 - Retrieves a representation of the order resource that belongs to a particular customer
 - 1 | > GET /customers/{cutomerId}/orders/{orderId}
- Operation openOrder(customerId)
 - Creates a new order for a customer

```
1 | > POST /customers/{cutomerId}/orders
2 | < Location: /customers/{customerId}/orders/{orderId}</pre>
```

- > GET /customers/{customerId}/orders/{orderId}
- Operation addLineItem(customerId, orderId)
 - Adds a new item to the order

- 4 > GET /customers/{customerId}/orders/{orderId}/items/{itemId}
- Operation closeOrder(customerId, orderId)
 - Closes the order (i.e., changes a state of the order resource)
 - 1 | > PUT /customers/{customerId}/orders/{orderId}
 - 2 > <status>CLOSED</status>

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

Examples – evaluate operation

- Example REST implementation of the SOAP service evaluate
- Operation evaluate(n1, n2)
 - Evaluates expression such that the result is n1+n2

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

- 25 -

Overview

- SOAP
- Representational State Transfer
- SOAP and REST Comparision

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

– 26 -

SOAP vs. REST

- SOAP uses input and output messages in operations
- REST uses resources and defines access on them
- SOAP can use more protocols
- REST uses HTTP
 - Pratically, most of the SOAP implementations use SOAP over HTTP
- Operations in SOAP are domain-specific
- HTTP operations are independent on domain semantics
 - REST operations' semantics is defined by HTTP method + resource semantics
- SOAP uses XML and XML Schema
- REST can use many representation formats
 - For example, XML, JSON, YAML, etc.
- SOAP is defined by WSDL
- REST is described in text or HTML
- Client libraries can be generated from WSDL
- REST vendor provides client libraries

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar

- 27

SOAP vs. REST

- SOAP clients must hard-code service's public process
- REST clients can follow links in hypertext for application states
- SOAP services are used for inter/intra-enterprise integration
- REST services are used for Web APIs for integration on the Web

Lecture 8: SOAP and REST, CTU Winter Semester 2016/2017, @TomasVitvar
