# **Overview**

- Architecture Overview
- Data, Functions and Processes
- Software Architecture

## **Global Architecture**

- A **structure** and a **behavior** of system's parts
- Complexity views on the global architecture
  - basic architectural views (also called dimensions): enterprise, data, functional, process, software, hardware.
- Development
  - basic **methodology** and **actors**:
    - ~ analysis, design, implementation, testing, maintenance
    - ~ end-user, architect, developer, administrator
  - basic architectural development levels:
    - ~ conceptual, logical, physical.
- Global architecture and cloud computing
  - data, functions, processes are application (domain) specific
  - software architecture defines a software platform
  - hardware architecture defines an **infrastructure**

# Enterprise Architecture Data Functions Processes Software Architecture Hardware Architecture

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

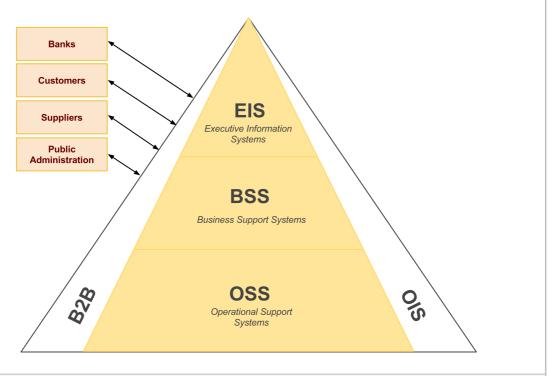

- 5 -

# **Enterprise Architecture Levels**

- Defines a structure of an enterprise system
  - Abstracts from data, functions, processes, software, hardware
  - divides enterprise system into functional blocks applications
    - → Order Management System (OMS)
    - → Customer Relationship System (CRM)
    - → Billing and Revenue Management (BRM)
  - applications correspond to **domains** such as sales, finance, procurement, production, etc.
- Enterprise architecture levels
  - Operational Support Systems (OSS)
  - Business Support System (BSS)
  - Executive Information Systems (EIS)
  - Office Information Systems (OIS)
  - Integration
    - $\rightarrow$  Business-to-Business (B2B)
    - → Enterprise Application Integration (EAI)

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

# **Enterprise Architecture Representation**

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

-7-

# **Organization Types**

- Customer
  - user needs: support for business processes
  - defines business requirements
  - roles: enterprise architect, developers, admins, users
- Supplier (enterprise system/application provider)
  - solutions and customization according to requirements
  - roles: technical and solution architects, developers, admins
- Vendor (technology provider)
  - product development according to market needs
  - roles: product managers, developers, reference users

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

## **Architect Roles**

- Technical Architect
  - Technical architecture design
  - technology configurations, performance
- Solution Architect
  - Requirements gathering, analysis
  - Solution design (data, functions, process)
- Enterprise Architect
  - High-level enterprise architecture design
    - $\rightarrow$  Applications, processes, data models
  - Should be aligned with industry standards
    - → APQC American Productivity & Quality Center (Process Classification Framework)
    - → TM Forum eTOM Enhanced Telekom Operations Map (Business Process Framework)

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

## **Overview**

- Architecture Overview
- Data, Functions and Processes
  - Integration
- Software Architecture

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

– 10 -

# **Syntax and Domain Semantics**

## Syntax

- Data format, representation, serialization
- Various languages at various architectural levels:
   XML, JSON, Class/object models in a specific programming language, SQL, DB native structures, ...
- They have formal grammars, can be checked for the correct syntax

## Domain semantics

- Meaning of terms in a domain they are being used
- We understand meaning of terms:
  - $\rightarrow$  Through syntax by using the natural language
  - → Through some **agreement** among users of the terms
- Every applications can use different semantics
  - $\rightarrow$  Need to mediate data from one application to another

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

- 13 -

# **Simplified Order Type Example**

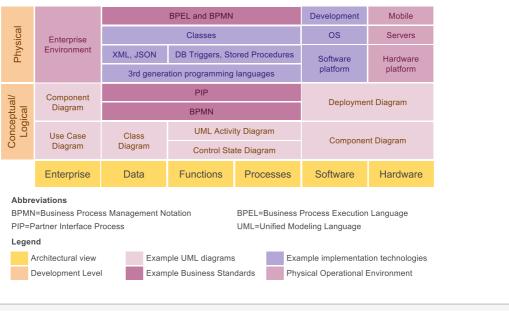

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

\_ 14 -

# **Overview of Representations**

- Languages to realize architectures
  - development levels × architectural views

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

- 15

## **Overview**

- Architecture Overview
- Data, Functions and Processes
  - Integration
- Software Architecture

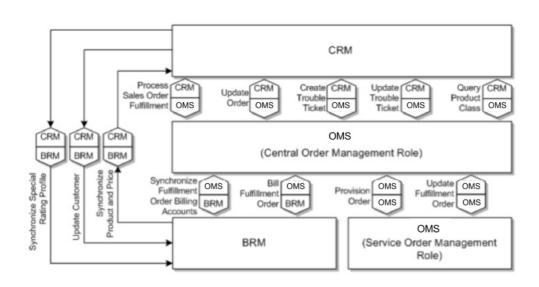

# **Integrating Applications**

- Enterprise Application Integration (EAI)
  - applications operate in a domain
  - functions and data often overlap across domains
  - need to integrate them
    - → applications can share data
    - → applications can share functionalities
    - → applications can communicate a result of one process may trigger another one
- Business-to-Business Integration (B2B)
  - automation support for communication and collaboration among enterprises
  - for example, B2B automates customers' orders processing, tracking orders, etc.

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

- 17 -

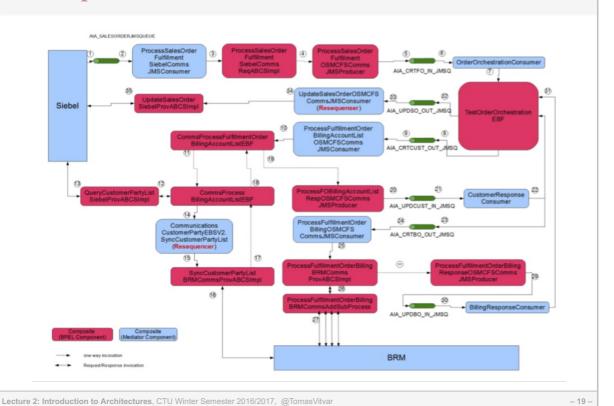

# **Integration Example – O2C**

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

\_ 18 -

# **Example Oracle O2C Technical Flows**

# **Integration Issues**

## • Key to integration = **interface**

- standards data, functions, processes, technical aspects
  - → enterprise standards, committee standards
  - → unified environment from a single vendor
- mediators
  - → where standard do not work out

#### Data

- Message exchange formats, data representation
  - $\rightarrow$  often standardized
- Semantics of data
  - $\rightarrow$  also standardized, more difficult

## • Functions and processes

- how apps' functionalities should be consumed and orchestrated, protocols, naming issues
- A service concept

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

\_ 20 -

## Overview

- Architecture Overview
- Data, Functions and Processes
- Software Architecture
  - Types, Separation of Concerns, Interface
  - Client/Server Architectures

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

\_ 21 -

# **Software Architecture Types**

- Centralized Client/Server (C/S)
  - Central server, a bunch of clients
  - monolithic, two-, three-, multi-tier architectures
  - Single point of failure!
    - $\rightarrow$  when a server fails the whole system fails
    - → need for a scalable and **highly reliable** server-side solutions
  - Enterprise systems (mostly) use centralized solutions
    - $\rightarrow$  But, enhanced with peer-to-peer principles
- Decentralized Peer-to-Peer (P2P)
  - Reliability
    - → when a node fails, other nodes take up its function
  - Scalability
    - → multiple nodes can share the load
    - → such as messaging systems in enterprise systems

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

# **Separation of Concerns**

# • Separation of Concerns

- also called Separation of Layers
- Concern any piece of interest (part) in the application
  - → concerns should overlap in functionality as little as possible
- Basic application concerns: data manipulation, data integrity, application logic, user-interactions
- Software architecture separates concerns into layers
  - → presentation, application, data

#### Interface

- ~ agreement on "how layers should communicate"
- most important artifact in Separation of Concerns
- If an interface is in place, application development and innovation can happen **independently** at each layer

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

- 23 -

#### **Software Architecture Layers** Functions and processes make up Data in various forms and App-specific the presentation and application representations are used across architectures the whole application. **Functions** Data **Processes Software Architecture Presentation Layer Application Layer** Presentation layer adopts processes that facilitate Data laver implements data **Data Layer** architecture using a storage interactions with users. technology. Client Server clients and servers adopt one-, Clients consume public two, three-, or multi-tier processes. Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

## **Interface**

### Definition

 Agreement (contract) between two or more layers during communication

## May be achieved by

- Through standards (accepted or enforced),
- Through a social agreement during design
- A dominant position of a technology on the market

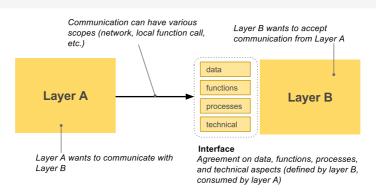

## • Interface includes subsets of domain architectures

- Subsets that are subject to communication between layers
- data defines communication language (syntax, semantics),
- functions defines entry points (operations),
- processes defines valid states and transitions between them
- technical details protocols, ports, IP addresses, etc.

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

- 25 -

# **Interface Scope**

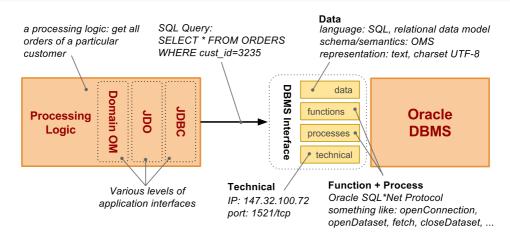

## Scope

- local: layer A and B on one machine
- network: layer A and B on separated machines (client/server)
- Application Programming Interface (API) ~ local scope
  - OS/complex apps' interface for extension development
- Web Services and Web API (network scope)
  - Web API is a new term API of Web Applications

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

- 26 -

# **Complex Interfaces**

- More levels of interfaces
  - 1. DBMS native interface
  - 2. JDBC universal connectors for various DBMS systems
  - 3. JDO mapping of Java classes to data objects
  - 4. Domain Object Model (OM) − app-specific (~API, SDK) − try to be as universal as possible; cover many technologies

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

– 27 –

## **Overview**

- Architecture Overview
- Data, Functions and Processes
- Software Architecture
  - Types, Separation of Concerns, Interface
  - Client/Server Architectures

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

# **Monolithic Architecture**

## All layers on a single machine

- usually non-portable apps; specific OS
- first types of computer systems, typical for 90-ties
- single-user only; standalone apps, minimal integration
- technologies: third-gen programming languages, local storage systems

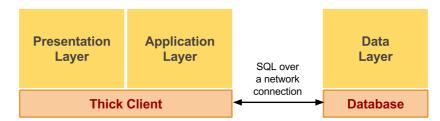

#### Drawbacks

- hard to maintain (updates, distribution of new versions)
- data security issues
- performance and scalability issues

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

- 29 -

## **Two-tier Client/Server Architecture**

## Presentation and app layers separated with data

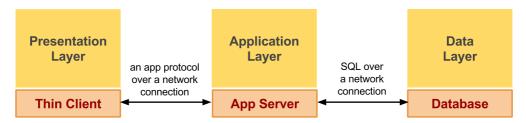

- Thick client desktop application, OS-dependent
- Data on a separate server (DBMS)
- Multi-user system, all sharing a database
- Storage system of high performance, transactions support
- SQL technology; native OS desktop application

#### Drawbacks

- Thick client hard to maintain (reinstallation with every update)
- No app logic sharing (only through copies)
- Data-oriented integration (integrity in the app logic!)

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

# **Three-tier Client/Server Architecture**

## All layers on separated machines

- Thin client desktop application or interpreted code
- Multi-user system, all sharing app logic and a database
- App server of high performance, scalability

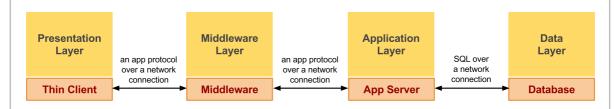

#### Drawbacks

- Spaghetti integration (see Lecture 1)
- Limited, single app server scalability

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

- 31 -

# **Multi-tier Client/Server Architecture**

# Additional middleware layer

- loose coupling, shift towards peer-to-peer architectures
- provides value-added services for communications
- individual servers or a compact solution (e.g., Enterprise Service Bus)

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar

# **Types of Middleware**

## • Scalability

- They help to achieve high performance through better scalability
- Messaging Servers (message queues, publish/subscribe)
- Load Balancers
- Proxy servers, reverse proxy

#### Functional

- They help to achieve more flexible integration
- Process servers
- Repositories, registries of services/components
- Mediators data interoperability, process interoperability, technical interoperability (SOAP server)
- Monitors for analytics of apps usages

## • Security

- Firewalls, Gateways, ...

Lecture 2: Introduction to Architectures, CTU Winter Semester 2016/2017, @TomasVitvar
