## Middleware and Web Services

### **Lecture 6: Integration Patterns**

#### doc. Ing. Tomáš Vitvar, Ph.D.

## **Enterprise Service Bus**

- ESB is a central intermediary in SOA
  - Types of services: shared and infrastructure
  - Types of processes: Technical and Business
- ESB Application
  - Application running on an application server
  - Exposes functionality via Web service interface
  - Allows to communicate with various messaging protocols
- Integration Patterns
  - Technical-level interoperability message broker
  - Location transparency
  - Dynamic routing
  - Data transformations mediator
  - Resequencing of messages
  - Session pooling
  - Service orchestrations BPMN, BPEL
  - Message enrichment

### **Major Vendors**

- Oracle
  - Oracle Service Bus (OSB)
  - Oracle SOA Suite
  - Oracle Enterprise Gateway (OEG)
- IBM
  - IBM WebSphere
- SAP
  - SAP NetWeaver
- Microsoft
  - .NET Framework
  - BizTalk server
- Opensource
  - -JBoss
  - Apache ServiceMix
  - WSMX Semantic Web Service Execution Environment

Lecture 6: Integration Patterns, CTU Winter Semester 2019/2020, @TomasVitvar

- 3 -

### **Integration Patterns**

- Applied in implementation of business services and processes
  - Usually a combination of more patterns
- Technical patterns
  - Deals with technical aspects of service communication
  - Message broker technical-level interoperability
  - Location transparency
  - Session pooling
- Business patterns
  - Deals with business aspects (message content) of service communication
  - Dynamic routing
  - − Data transformations − mediator
  - Service orchestrations BPMN, BPEL
  - Message enrichment
  - Resequencing of messages

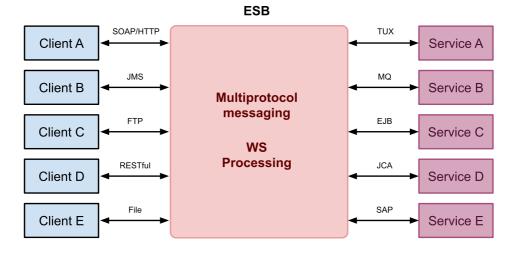

Lecture 6: Integration Patterns, CTU Winter Semester 2019/2020, @TomasVitvar

- 4 -

### **Message Broker**

### • Message broker

- ESB can mix and match transports both standard and proprietary

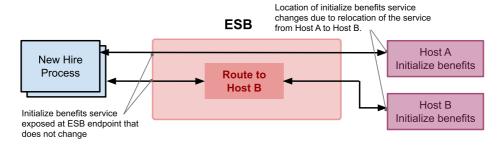

Lecture 6: Integration Patterns, CTU Winter Semester 2019/2020, @TomasVitvar

- 5 -

# **Location Transparency**

- Location transparency
  - ESB can hide changes in location of services
  - Such changes will not affect clients
  - Can also be used for load balancing for multiple service instances

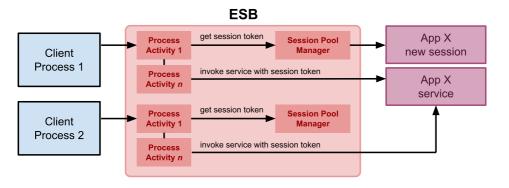

Lecture 6: Integration Patterns, CTU Winter Semester 2019/2020, @TomasVitvar

- 6

### **Session Pooling**

### • Session Pooling

- ESB can maintain a pool of connections (session tokens) to a back-end app when creating a new connection is expensive
- A single session token can be reused by multiple instances of business processes

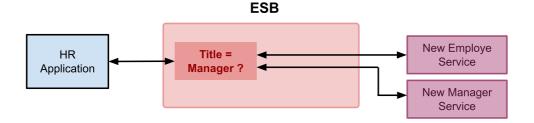

Lecture 6: Integration Patterns, CTU Winter Semester 2019/2020, @TomasVitvar

-7-

# **Dynamic Routing**

### • Dynamic routing

- ESB exposes a service that routes to various back-end services based on message contents.

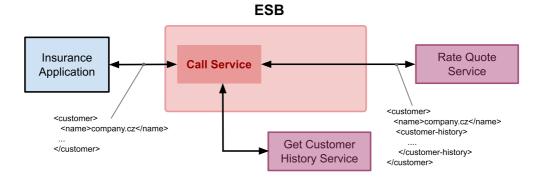

Lecture 6: Integration Patterns, CTU Winter Semester 2019/2020, @TomasVitvar

- 8

### **Message Enrichment**

### • Message enrichmenet

- Enriches a message before invoking back-end application service.

Lecture 6: Integration Patterns, CTU Winter Semester 2019/2020, @TomasVitvar

\_ 9 -

#### **Data Transformation**

- Data transformation phases:
  - Definition of mapping and execution of mappings
- Definition of mappings (design-time)
  - A mapping associates one data structure to another data structure and defines a conversion between them.
  - Mapping languages
    - $\rightarrow$  graphical for design that translates to XSLT, XQuery
    - $\rightarrow$  Sometimes implemented in 3rd gen. languages (e.g., Java)
- Execution of mappings (runtime)
  - application of mappings to instance data
- CDM terminology
  - Application Business Message back-end app format
  - Enterprise Business Message CDM format

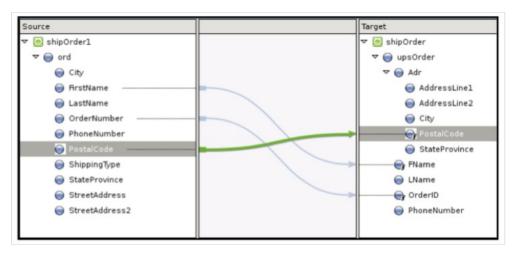

Lecture 6: Integration Patterns, CTU Winter Semester 2019/2020, @TomasVitvar

– 10 –

### **Definitions of Data Mapping Example**

#### Source and target schemas

- Source: Order flat data structure
- Target: UPS order with address as a sub-entity
- Differences in names of entities
- Conversion function applied to postal code

Lecture 6: Integration Patterns, CTU Winter Semester 2019/2020, @TomasVitvar

– 11 –

#### **Service Orchestration**

#### Orchestration of multiple business services

- Includes transformation, message enrichmenet, service callouts, etc.
- A step in orchestration is an activity

#### Patterns

- Sequential processing of activities
- Parallel processing of activities with synchronization points
- Decision branches, iterations

#### Technologies

- Graphical languages
- Standard representations: BPEL, BPMN
- Proprietary, for example OSB uses graphical language that translates to XQuery

### Good design

- Orchestration faciliates communication in CDM
- Orchestration handles key-mapping

Lecture 6: Integration Patterns, CTU Winter Semester 2019/2020, @TomasVitvar

### **Key Mapping**

#### • What is key mapping

- -Key = identifier of en entity in a back-end application
- Key Mapping = a mapping of an ID of an entity in one system to an ID of the same entity in another system.
- Key mapping is realized using universal IDs (UID)

#### • Example

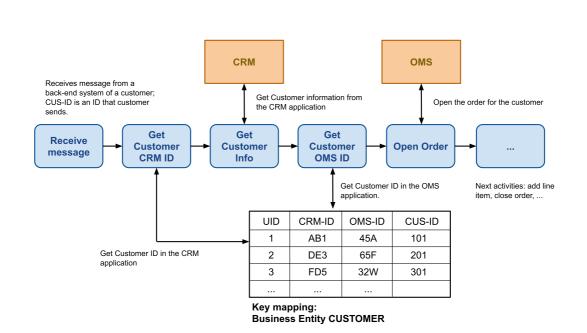

- A customer MOON exists in CRM and OMS systems
- In CRM system, MOON has an CRM-ID=AB1
- In OMS system, MOON has an CRM-ID=45A
- Key mappig allows to map the CRM-ID AB1 to the OMS-ID 45A
- Key mapping is a table

CRM-ID → UID → OMS-ID

Lecture 6: Integration Patterns, CTU Winter Semester 2019/2020, @TomasVitvar

# **Key Mapping Example**

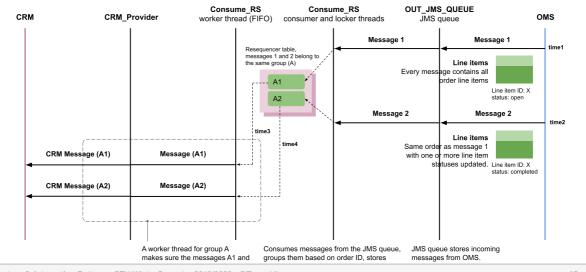

Lecture 6: Integration Patterns, CTU Winter Semester 2019/2020, @TomasVitvar

\_ 14 -

# **Message Sequencing**

- Resequencer in update sales order
  - Every order line item needs to update its status several times (e.g. open, completed)
  - Resequencer makes sure that the update status messages arrive to CRM in the same order as they were created in OMS system (FIFO resequencer)

Lecture 6: Integration Patterns, CTU Winter Semester 2019/2020, @TomasVitvar
