## **Good Performance**

- What influences good performance?
  - Number of users and concurrent connections
  - Number of messages and messages' sizes
  - Number of services
  - Infrastructure capacity, availability, configuration, ...
- How can we achieve good performance?
  - $-{\it Infrastructure}$ 
    - → Scalability, failover, cluster architectures
  - Performance tuning
    - → Application Server, JVM memory, OS-level tuning, Work managers configuration
  - Service configuration
    - → Parallel processing, process optimization

#### **Overview**

- Definitions
- Load Balancers
- Performance Tuning

Lecture 6: High Availability and Performance, CTU Winter Semester 2020/2021, @TomasVitvar

- 3 -

### **Definitions**

- Scalability
  - server scalability
    - $\rightarrow$  ability of a system to scale when input load changes
    - $\rightarrow$  users should not feel a difference when more users access the same application at the same time
    - $\rightarrow$  horizontal scaling
      - → adding new instances of applications/servers
    - $\rightarrow$  vertical scaling
      - → adding new resources (CPU, memory) to a server instance
  - network traffic
    - → bandwidth capacity influences performance too
    - → service should limit the network traffic through caching
- Availability
  - probability that a service is operational at a particular time
    - $\rightarrow$  e.g., 99.9987% availability downtime ~44 seconds/year
- SLA Service Level Agreement
  - Guarantee of service availability
  - When availability is below a guaranteed value, a customer can get a discount

Lecture 6: High Availability and Performance, CTU Winter Semester 2020/2021, @TomasVitvar

- 4 -

## **Definitions (Cont.)**

#### • High Availability

- When a server instance fails, operation of the application can continue
- Failures should affect application availability and performance as little as possible

#### Application Failover

- When an application component performing a job becomes unavailable, a copy of the failed object finishes the job.
- Issues
  - $\rightarrow$  A copy of the failed object must be available
  - $\rightarrow$  A location and operational status of available objects must be available
  - $\rightarrow$  A processing state must be replicated

#### Load Balancing

- Distribution of incoming requests across server instances

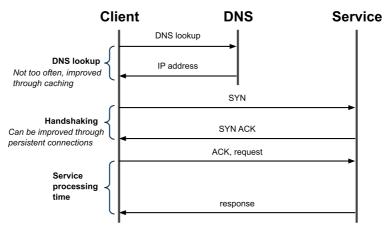

Lecture 6: High Availability and Performance, CTU Winter Semester 2020/2021, @TomasVitvar

- 5 -

#### **Performance Metrics**

#### • Response Time

- A client-side metric

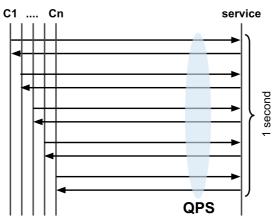

- CPU intensive service or a bad configuration of a service
  - → consider asynchronous processing when CPU intensive
- Writing to a data store

Lecture 6: High Availability and Performance, CTU Winter Semester 2020/2021, @TomasVitvar

- 6

## **Performance Metrics**

- Queries/Requests per Second (QPS)
  - − *A server-side metric*

- Caching may improve performance
  - → even if data changes often, with high QPS caching improves a lot

Lecture 6: High Availability and Performance, CTU Winter Semester 2020/2021, @TomasVitvar

-7-

## **Overview**

- Definitions
- Load Balancers
- Performance Tuning

Lecture 6: High Availability and Performance, CTU Winter Semester 2020/2021, @TomasVitvar

- 8

## **Load Balancing**

- Distributes a load to multiple app/object instances
  - App instances run on different machines
  - Load sharing: equal or with preferences
  - Health checks
- Types
  - DNS-based load balancer
    - → DNS Round Robin
  - NAT-based load balancer (Layer-4)
  - Reverse-proxy load balancer (Layer-7)
    - $\rightarrow$  application layer
    - → Sticky sessions
      - → JSession. JSession-aware load balancer
  - Client-side load balancer
    - $\rightarrow$  LB run by a client
    - $\rightarrow$  a client uses a replica-aware stub of the object from the server

Lecture 6: High Availability and Performance, CTU Winter Semester 2020/2021, @TomasVitvar

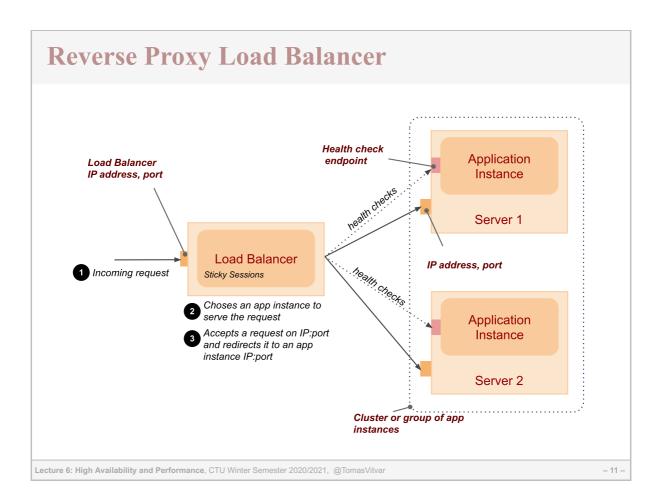

- 9 -

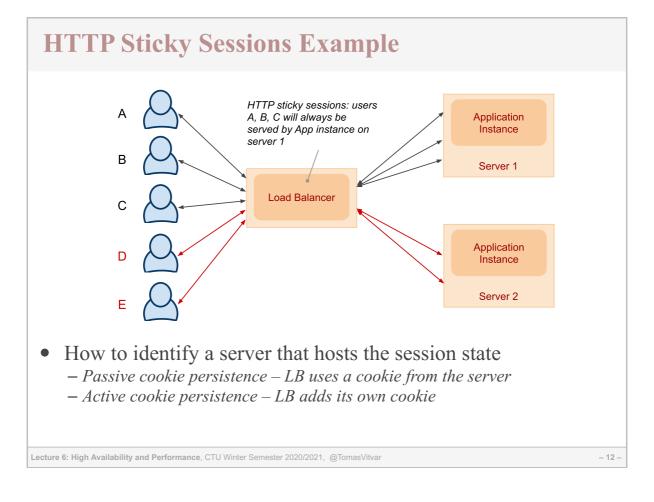

#### **DNS-based Load Balancer**

- DNS Round Robin
  - A DNS record has multiple assigned IP addresses
  - DNS system delivers different IP addresses from the list
  - Example DNS A Record: company.com A 147.32.100.71 147.32.100.72 147.32.100.73
- Advantages
  - Very simple, easy to implement
- Disadvantages
  - IP address in cache, could take hours to re-assign
  - No information about servers' loads and health

Lecture 6: High Availability and Performance, CTU Winter Semester 2020/2021, @TomasVitvar

\_ 10 -

## **Types of Load Balancers**

- Software
  - Apache mod\_proxy\_balancer
    - → HTTP Session persistence sticky sessions
  - WebLogic proxy plug-in

/soa-infra is a first part of an URL path that rules in this Location will be applied (this is a standard Apache configuration mechanism)
czfmwapp{N} is a hostname that corresponds to a virtual IP to which the managed server JVM processes is bounded (using the tcp port 8001).
WebLogicCluster specifies the list of servers for load balancing

- Hardware
  - Cisco, Avaya, Barracude

Lecture 6: High Availability and Performance, CTU Winter Semester 2020/2021, @TomasVitvar

# **Round-Robin Algorithm**

Uses

```
request — client request with or without a cookie information

server_list — a list of servers that can process the request

rbinx — round robin index

sticky_sessions — associative array of pairs <session_id,server>
unhealthy_treshhold — a number of negative consecutive health checks before moving the server to the "unhealthy" state.
```

- Round Robin Algorithm
  - − if session\_id exist in the request and in sticky\_sessions
    - → send the request to the server sticky\_sessions[session\_id]
  - otherwise
    - $\rightarrow$  send the request to the rbinx server in the server list
    - $\rightarrow$  extract session id from the response from the server
    - $\rightarrow$  if the session\_id exist, add a pair <session\_id;server\_list[rbinx]> to sticky\_sessions
    - $\rightarrow$  increase rbinx by one or reset it to 0 if it exceeds the length of server\_list

Lecture 6: High Availability and Performance, CTU Winter Semester 2020/2021, @TomasVitvar

– 14 –

#### **Health Check**

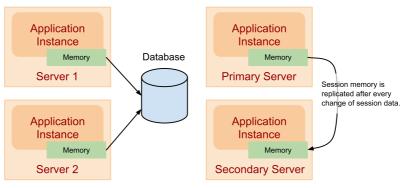

#### • Health Check

- For each server in the server\_list
  - → call the server's heatlhcheck endpoint
  - ightarrow if a number of failed health checks for the server exceeds the unhealthy\_threshold
    - → remove the server from the server\_list
  - → if the server was unhealthy and a there was a successful healthcheck
    - → add the server back to the server\_list

Lecture 6: High Availability and Performance, CTU Winter Semester 2020/2021, @TomasVitvar

- 15 -

# **Session State Persistence and Replication**

Session DB persistence

**In-Memory Replication** 

#### Session persistence

- Session information is maintained in the database
- Does not require sticky sessions
- Implements HttpSession interface that writes data to the DB

#### In-memory replication

- A primary server holds a session state, the secondary server holds its replica.
- Information about primary and secondary servers are part of JSession

Lecture 6: High Availability and Performance, CTU Winter Semester 2020/2021, @TomasVitvar

– 16 -

# **In-Memory Replication**

#### Session format

- It's a cookie
- JSESSIONID=SESSION\_ID!PRIM\_SERVER\_ID!SEC\_SERVER\_ID!CREATION\_TIME

SESSION\_ID – session id, generated by the server to identify memory associated with the session on the server

#### How LB uses this information

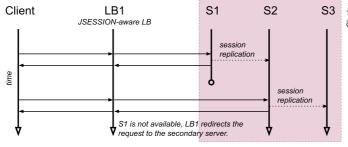

- LB has information whether the server is running or not (via healthchecks)
- if the primary server is running, it redirects the request there
- if the primary server is not running, it redirects the request to the secondary server directly
- if primary and secondary servers are not running, it redirect the request to any other server it has in the list this may cause side effects!

Lecture 6: High Availability and Performance, CTU Winter Semester 2020/2021, @TomasVitvar

- 17 -

# **In-Memory Replication Scenarios**

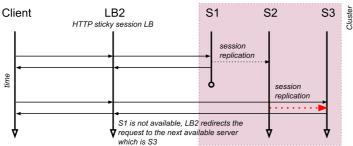

#### Scenario A: JSession-aware load balancer

S1 is primary, S2 is secondary; S1 replicates the session to S2

S1 fails, S2 becomes primary, S3 becomes secondary; LB1 directly redirects the request to S2 as it knows the secondary server from the first request.

#### Scenario B: HTTP sticky session load balancer

S1 is primary, S2 is secondary; S1 replicates the session to S2

S1 fails, S3 discovers that S2 has a session and gets the session data from it. S3 becomes primary and S2 becomes secondary.

## **Overview**

- Definitions
- Load Balancers
- Performance Tuning

Lecture 6: High Availability and Performance, CTU Winter Semester 2020/2021, @TomasVitvar

**- 19** -

## **Monitoring**

- Important to understand performance
  - DevOps monitoring trends
- What you need
  - Collect  $\rightarrow$  Filter  $\rightarrow$  Store  $\rightarrow$  View  $\rightarrow$  Tune
  - Metrics, dashboards, alerting, log management, reporting, tracing capabilities
  - It is necessary to organize metrics well in order to understand what is going on
  - Start from a high-level process, detail to technical components
- Source
  - Application server
    - → usually management beans with JMX interfaces
    - $\rightarrow$  log files (access logs, server logs, etc.)
  - -OS
    - $\rightarrow$  many utilities available out of the box
    - → open sockets, memory, context switches, I/O performance, CPU usage
  - Database
    - $\rightarrow$  applications may write metrics to the DB
    - $\rightarrow$  SQL scripts to collect metrics

Lecture 6: High Availability and Performance, CTU Winter Semester 2020/2021, @TomasVitvar

\_ 21 -

# **Monitoring Tools**

- Commercial Monitoring Solutions
  - Application server vendor usually offers a monitoring solution
  - AppDynamics, Oracle Enterprise Manager, Splunk
  - Google stackdriver, Amazon AWS CloudWatch
- Open source examples
  - Elasticsearch + LogStash + Kibana
  - InfluxDB + Telegraph + DataGraph
